

The world-renowned alarm movement Nr. 231

Plates 7,1 x 5,6 cm = 2 $\frac{3}{4}$ x 2 $\frac{1}{16}$ inches

1 day alarm, standard movement, large balance-wheel. All toothed wheels are cut from a special brand of hardened brassmaterial. Lantern pinions are made of hardened quality steel and highly polished. Plates are designated, therefore they keep longer and look better.

Junghans have added a screw slot to the winding arbors. A screwdriver is inserted in this which fixes them and avoids a sawing-off in case the click spring is broken. This allows the key to be screwed out without trouble and the back of the case to be removed. An easy and quick repair-possibility is a further advantage of Junghans Alarmclock-movements.
